

We care about the environment and make conservation a priority in every project.

Transmission structures installed by helicopters, not cranes and heavy trucks...

...and designed to protect birds while flying and perching.

Delaware River marshes protected by wetland scientist, biologist, and archaeology survey teams.

A Delaware conservation win: We are working to procure more than 200 acres to be preserved for public recreation & conservation.

We show our respect for the environment by...

...avoiding sediment disturbances near oyster beds and crab habitat.

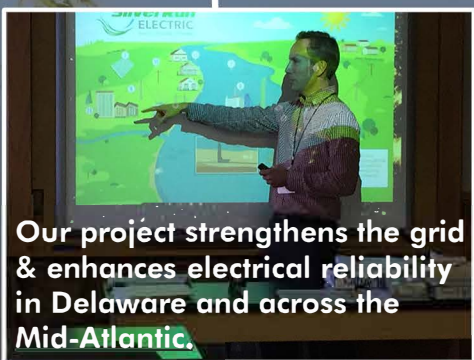

...timing riverbed activities to avoid spawning fish.

...studying worms to learn about the diversity of the riverbed.

...locating our transmission lines along the most environmentally protective route.

Our project strengthens the grid & enhances electrical reliability in Delaware and across the Mid-Atlantic.

Our commitment to environmental protection is central to our mission.
